```javascript
let facemesh;
let video;
let predictions = [];

function setup() {
  createCanvas(640, 480);
  video = createCapture(VIDEO);
  video.size(width, height);

  facemesh = ml5.facemesh(video, modelReady);

  // This sets up an event that fills the global variable
"predictions"
  // with an array every time new predictions are made
  facemesh.on("predict", results => {
    predictions = results;
  });

  // Hide the video element, and just show the canvas
  video.hide();
}

function modelReady() {
  console.log("Model ready!");
```
